

ABSTRACT

During the time when a mobile station of a communicating party receives a signal from another base, a synchronization control section 101 instructs stop of signal transmission to 5 a control section 102-1, which corresponds to a system that transmits a signal with carrier frequency f_1 at which a signal is received from another base station, and a control section 102-2, which corresponds to a system that transmits a signal with carrier frequency f_2 adjacent to a frequency at which a 10 signal is received from another base station. When receiving instructions to stop the transmission from the synchronization control section 101, a control sections 102-1 and 102-2 instruct switch 104-1 and a switch 104-2 to cut off a signal to be transmitted and instruct an RF analog section 107-1 and an RF 15 analog section 107-2 to stop the signal transmission.
